UML Class Diagram (also in the zip file as a pdf):

I have choosen to make the courses as submodules of an abstract class "Course". That way I can create instances of the specific courses while still having access to the methods of "Course".

There is a has-a relationthip between "Bachelor Programme" and "Course".

This is my Kanban board. I created all the items before I started coding. I took this screenshot early in the process when I was just getting started.
